1. *Pan troglodytes*
(chimpanzee)

- Face & jaw larger than skull vault
- Foramen magnum in back of skull
- Brow ridge present
- Sagittal crest present in males
- Fivehead sloping
3. H. habilis

Afterwards was dropped, when Homo habilis was found soon considered the first Homo. Australopithecus, all the evidence suggest the species of this species. Louis Leakey briefly

was the first brain size is about 520 cc. This was the first species, it is in almost complete cranium: with a

years. Leakey in 1959 estimated age is 1.6 million

Leakey in 1959 at Olduvai Gorge in Tanzania

S. Homo erectus

Individual KNM-ER 3733 was found above the KBS level. An adult male, the two lower磨 was found in the same level as KNM-ER 3733. The other side of this individual was found in the same level as KNM-ER 3733. The skull is similar in size to those from Zhoukoudian in China. However, the cranial capacity has been reduced slightly, which is similar to the size of modern humans. The skull is also similar to the size of modern humans. The left half and the lower end of the right half is the smaller of the two. However, the left half of the lower end of the right half is larger than the right half.

The partial skull KNM-ER 1470 was discovered in 1972 at Koobi Fora in Kenya. Estimated age is 1.9 million years. KNM-ER 1470 was discovered by Bernard Ngeneo in 1972 at Koobi Fora. It was assigned to Homo erectus by Leakey and Walker (1976). It is one of the more complete crania from the Koobi Fora region. The discovery of this fossil is the same stream as ER 1406. The discovery of this fossil is the same stream as ER 1406. The discovery of this fossil is the same stream as ER 1406. The discovery of this fossil is the same stream as ER 1406.
7. Homo Sapiens

- brow ridge slightly present
- jaw face
- skull vault lower than
- brow ridges present
- occipital bone and parietals present
- parietals present
- occipital bone
- brow ridge
- brow ridges pronounced
- last
